

Downloading MicroROS Agent on RaspberryPi

Option 2: Build from Source (The *Correct* Way)

To build it successfully, you must use the **setup scripts** which download the missing dependencies (like FastDDS).

1. Create a dedicated workspace (Keep it separate from slambot_ws!)

Bash

```
mkdir -p ~/ros_workspaces/microros_ws/src  
cd ~/ros_workspaces/microros_ws/src
```

2. Clone the Setup Repo

Bash

```
git clone -b jazzy https://github.com/micro-ROS/micro_ros_setup.git
```

3. Build the Setup Package

Bash

```
cd ~/ros_workspaces/microros_ws  
rosdep update && rosdep install --from-paths src --ignore-src -y  
colcon build  
source install/local_setup.bash
```

4. Download the Agent Source & Dependencies *This is the magic step you were missing before.*

Bash

```
ros2 run micro_ros_setup create_agent_ws.sh
```

5. Compile the Agent *This will take 10-15 minutes on a Pi 5.*

Bash

```
ros2 run micro_ros_setup build_agent.sh  
source install/local_setup.bash
```

6. Run it

Bash

```
ros2 run micro_ros_agent micro_ros_agent serial --dev /dev/ttyACM0  
baudrate=115200
```
